theSkyNet POGS

**A BOINC based, citizen-science
project for pixel Spectral Energy
Distribution fitting of resolved
galaxies in multi-wavelength
surveys**

Kevin Vinsen (ICRAR, UWA)
David Thilker (JHU)

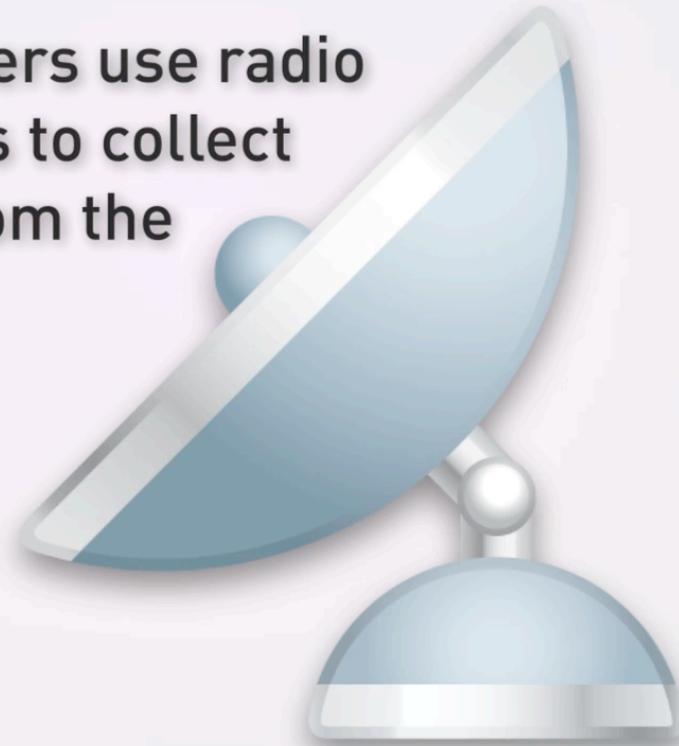

THE UNIVERSITY OF
WESTERN AUSTRALIA
Achieve International Excellence

Why theSkyNet

- SKA and LSST will bring even more data size problems.
- ICRAR looking for an experiment to see if we can off load the computing.
- We wanted a systematic way of processing very large volumes of data.
- So in 2011 we started theSkyNet.

Astronomers use radio
telescopes to collect
signals from the
Universe

theSkyNet Pan-STARRS1 Optical Galaxy Survey (POGS)

- POGS

- Local low redshift Galaxies only $z < 0.1$
- Pan-STARRS1, SDSS, GALEX & WISE
- SED fit to each pixel

A BOINC based, citizen-science project for pixel Spectral Energy Distribution fitting of resolved galaxies in multi-wavelength surveys

Kevin Vinsen, David Thilker

(Submitted on 7 Jun 2013 (v1), last revised 20 Sep 2013 (this version, v2))

In this work we present our experience from the first year of theSkyNet Pan-STARRS1 Optical Galaxy Survey (POGS) project. This citizen-scientist driven research project uses the Berkeley Open Infrastructure for Network Computing (BOINC) middleware and thousands of Internet-connected computers to measure the resolved galactic structural properties of ~100,000 low redshift galaxies.

It would take between 1,000 and 2,000 years on a modern desktop

What we're trying to do

- Fundamentally **panchromatic** (UV-opt-IR)
 - Pixel SED fitting for resolved physical interpretation
 - Maps of stellar mass, SFR, etc showing sub-structure of the galaxy.
 - Detailed multi-wavelength parametric galaxy decomposition
 - Atlas of galaxies
- Bulge/disk ratios, scale lengths, break radii
- Citizen-scientist involvement in multiple ways - possible as part of Galaxy Zoo for the next stage

MAGPHYS

- <http://www.iap.fr/magphys/magphys/MAGPHYS.html>
- da Cunha et al. (2008, MNRAS, 388, 1595)
 - SFH are computed using the Bruzual and Charlot population synthesis code - (2003, MNRAS, 344, 1000)
 - two-component model of Charlot and Fall (2000, ApJ, 539, 718)
- MAGPHYS takes brute force approach to UV-Opt-IR SED fitting
 - Compares data to each possible model in large multi-dimensional parameter space
 - Allows estimation of marginalised probability distribution for each parameter.
 - Far too compute intensive to do pixel-based fits on a single machine
- Distributed computing / citizen-science allows SED processing
 - We feed multi-extension FITS files with resolution matched panchromatic images per galaxy and correct S/N per pixel

What MAGPHYS calculates

Parameter	Description	Parameter	Description
f_{μ}^{SFH}	the fraction of total infrared luminosity contributed by dust in the ambient ISM from the stellar population spectrum model	T_W^{BC}	characteristic temperature of warm dust grains residing in stellar birth clouds
f_{μ}^{IR}	the fraction of total infrared luminosity contributed by dust in the ambient ISM from the infrared spectrum model	ξ_{SC}^{tot}	the total contribution of cold dust grains to the total infrared luminosity of a galaxy
μ	fraction of the total effective V-band absorption optical depth of the dust contributed by the ambient ISM	ξ_{PAH}^{tot}	the total contribution of Polycyclic Aromatic Hydrocarbons (PAH) to the total infrared luminosity of a galaxy
$\hat{\tau}_V$	total effective V-band absorption optical depth of the dust seen by young stars inside birth clouds	ξ_{MIR}^{tot}	the total contribution of mid-infrared continuum emissions to the total infrared luminosity of a galaxy
ψ_S	specific star formation rate	ξ_{SW}^{tot}	the total contribution of warm dust grains to the total infrared luminosity of a galaxy
M_*	the stellar mass of the galaxy	$\mu\hat{\tau}_V$	effective V-band absorption optical depth of the dust in the ambient ISM
L_d^{tot}	total luminosity absorbed and reradiated by dust	M_d	the total dust mass of a galaxy
T_C^{ISM}	characteristic temperature of cold dust grains which can only reside in the ambient interstellar medium	$\psi(t)$	star formation rate

What we record

- Best Fit
- Median - 50th Percentile
- Highest Probability bin
- 2.5th Percentile
- 16th Percentile
- 84th Percentile
- 94.5th Percentile

- And all Probability Distribution Histograms

To date (24-Sept-2013)

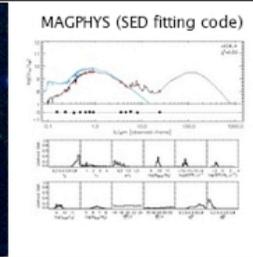

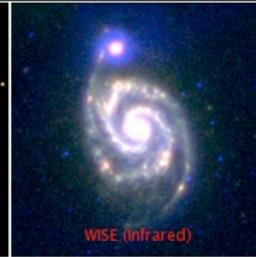

- Processing
 - 4,400+ Users (SETI@Home 1.4 million)
 - 11,200+ Computers (Einstein@Home 5.6 million)
 - 8,015+ Galaxies
 - 50 Million+ Pixels

About theSkyNet POGS - the PS1 Optical Galaxy Survey

[English](#) [Français](#) [Русский](#) [Deutsch](#) [Italiano](#) [中文](#)

TheSkyNet POGS is a research project that uses Internet-connected computers to do research in astronomy. We will combine the spectral coverage of GALEX, Pan-STARRS1, and WISE to generate a multi-wavelength UV-optical-NIR galaxy atlas for the nearby Universe. We will calculate physical parameters such as: star formation rate, stellar mass of the galaxy, dust attenuation, and total dust mass of a galaxy; on a pixel-by-pixel basis using spectral energy distribution fitting techniques. You can participate by downloading and running a free program on your computer.

TheSkyNet POGS is based at The International Centre for Radio Astronomy Research.

Today is International Talk like a Pirate Day <http://www.talklikeapirate.com>.

TheSkyNet website offers a Pirate language option <http://www.theskynet.org/?locale=arr> to celebrate. 19 Sep 2013, 3:16:28 UTC · [Comment](#)

More galaxies

I've just queued another 819 PS1 only Images of galaxies in NED with RA = 30-40 deg, DEC = -30-80 deg, and NED diameter of 1-3 arcmin. 16 Sep 2013, 2:09:35 UTC · [Comment](#)

2nd Birthday

TheSkyNet is celebrating its two year anniversary today with the official launch of a new web site, as well as a range of improvements and new features to make contributing to astronomical research at home more enjoyable, and even easier.

Go and have a look at <http://www.theskynet.org>. Your email (the one you registered when you joined BOINC) and password will get

Play your part and help discover our Universe!

Have a computer? Want to help astronomers make awesome discoveries and understand our Universe? Then theSkyNet needs you!

You're currently contributing **81.68 GFLOPS**

[f](#) [t](#) **43.05** [↑](#) **TFLOPS**

LATEST STATS Total TFLOPS is currently 43 and is going up

What is theSkyNet?

Your computer is bored. It has spare computing power nearly all the time that could be used to do something cool. So why not let it? By connecting 100s and 1000s of computers together through the Internet, it's possible to simulate a single machine capable of doing some pretty amazing stuff. That's what theSkyNet is all about - using your

Why should I join?

- Contribute to real scientific research and help scientists unlock the mysteries of our Universe!
- Track your contribution and see how you compare against your friends, colleagues and the world!

Specials

The Founder

– theSkyNet Founding Member – Our approximately 3,000 founding members all signed up in the first 24 hours of theSkyNet on September 13th, 2011.

Arrrrrrrrr

Get ye some loot ye landlubber. Happy talk like a pirate day 2013 ye scurvy dog. Thanks for crunching some of our information stuff. Now, walk the plank!

2nd Birthday

13-September-2013 We're two years old, and you came to the party. Awww, you're so kind. Thank you! Have a slice of birthday pie.

Beta

An exclusive for helping beta test theSkyNet T2. Thank you to all our amazing beta testers.

Bad things happen

Coming Soon

- GPU Version of MAGPHYS
- Alternative SED fitting methods
- Ensemble Methods to statistically merge data
- Special un-obfuscated colour maps for astronomers
- IVOA gateway to allow you to request data

Coming Soon II

- 16 more physical parameters

Parameter	Description	Parameter	Description
tform/yr	formation time of the galaxy (years)	t(lastB)	time of the last burst of star formation (yr)
gamma	timescale of exponentially-declining SF (Gyr^{-1})	Fb(1e6)	fraction of stellar mass formed in bursts over the last 10^6 yrs
Z/Zo	metallicity (solar units)	Fb(1e7)	fraction of stellar mass formed in bursts over the last 10^7 yrs
SFR(1e6)	SFR averaged over the last 10^6 years (Msun/yr)	Fb(1e8)	fraction of stellar mass formed in bursts over the last 10^8 yrs
SFR(1e7)	SFR averaged over the last 10^7 years (Msun/yr)	Fb(1e9)	fraction of stellar mass formed in bursts over the last 10^9 yrs
SFR(1e8)	SFR averaged over the last 10^8 years (Msun/yr)	Fb(2e9)	fraction of stellar mass formed in bursts over the last 2×10^9 yrs
SFR(1e9)	SFR averaged over the last 10^9 years (Msun/yr)	age(M)	mass-weighted age (years)
SFR(2e9)	SFR averaged over the last 2×10^9 years (Msun/yr)	age(r)	r-band light-weighted age (years)

Conclusions

- Doing 110 Galaxies a day at the moment - the whole survey in under three years
- BOINC is very stable
- AWS Bill around \$550 a month
- All software available under LGPL
 - <https://github.com/ICRAR/boinc-magphys>
- BOINC Volunteers are FANTASTIC
- Forums chew up a HUGE chunk of your time

Any Questions

- I'm "hard of hearing" - I wear hearing aids so please speak clearly.
